

# Lionfish Control in Belize: The Potential for Regional Replication

Fabian Kyne & Celso Sho

Belize Marine Fund Webinar - August 18, 2022

# Background

Map of native range of *Pterois volitans* (green) and *P. miles* (blue) adapted from Schultz (1986) and Randall (2005). Stars in Mediterranean Sea denote Lessepsian migration of *P. miles* via the Suez Canal (Golani and Sonin 1992; Bariche et al. 2013; Turan et al. 2014). Non-native range of *P. volitans* and *P. miles* in the Americas is shown in red (from Schofield et al. 2012). Predicted future distribution of lionfish along coastal South America is shown in red hatching (Morris and Whitfield 2009). Lionfish are continuing to expand westward in the Mediterranean Sea (red shading). See Azzurro et al. (2017) for a review.

# Characteristics of a successful invader

- No natural predators
- Fast growth
- Reproduce every 3-4 days (2 million eggs/year)
- Ecological generalist (0 > 300m depth)
- Skillful hunters (jet stream, corner prey)
- High food availability (reefs has high biodiversity)
- Unrecognized by native prey species

# Lionfish grow and mature faster than most WA mesopredators

Species	Common name	Method	Fecundity	Minimum age at maturity	Growth rate $k$ (cm per year)
<i>Pterois volitans</i> (introduced range)	Red lionfish	3	PE: 10,790–41,392 <sup>1</sup> A: 2,000,000 <sup>1</sup> (25.0–35.0 TL)	<1 year <sup>1</sup>	0.47 <sup>9</sup>
<i>Lutjanus analis</i>	Mutton snapper	?	PE/A: 373,000–1,370,000 <sup>8</sup> (46–55 cm TL; Bahamas)	2 years <sup>5</sup>	0.13–0.25 <sup>5</sup>
<i>Lutjanus apodus</i>	Schoolmaster	–	–	–	0.35 <sup>5</sup>
<i>Lutjanus griseus</i>	Grey snapper	–	–	–	0.10–0.24 <sup>5</sup>
<i>Lutjanus jocu</i>	Dog snapper	–	–	–	0.10 <sup>5</sup>
<i>Lutjanus mahogoni</i>	Mahogany snapper	–	–	–	0.10 <sup>5</sup>
<i>Cephalopholis fulva</i>	Coney grouper	1	PE/A?: 67,883–282,389 <sup>2</sup> (23.2–24.3 TL; Jamaica)	1.1 year <sup>6</sup>	0.14–0.63 <sup>5</sup>
<i>Epinephelus adscensionis</i>	Rock hind	–	–	–	0.11–0.17 <sup>5</sup>
<i>Epinephelus guttatus</i>	Red hind	1	PE/A: 96,000–526,000 <sup>2</sup> (26.0–41.0 TL; Jamaica)	2 years <sup>7</sup>	0.12–0.24 <sup>5</sup>
		2	PE/A: 978,620 (mean) <sup>10</sup> (mean: 36.7 TL; US Virgin Islands)		
<i>Epinephelus striatus</i>	Nassau grouper	1	PE/A: 350,000–6,500,000 <sup>3</sup> (30.0–70.0 SL; Belize)	4 years <sup>3</sup>	0.06–0.22 <sup>5</sup>
		1	PE/A: 11,724 – 4,327,440 <sup>3</sup> (47.5–68.6 SL; Bahamas)		
<i>Mycteroperca tigris</i>	Tiger grouper	1	PE/A: 308,060–1,972,434 <sup>4</sup> (25.5–37.5 SL; Puerto Rico)	2 years <sup>4</sup>	0.11 <sup>5</sup>

unlikely

~~Eradication~~

Control

# Significant ecological Impacts

“The most significant change to coral reefs since industrial fishing”

# Some fish are impacted more than others

- *Small, shallow-bodied, solitary* fishes - **most vulnerable**
- Fishes that show *cleaning behaviour* - **lower risk**

TRAIT	MORE VULNERABLE	LESS VULNERABLE
Size	Small, e.g. greenblotch parrotfish 	Large, e.g. graysby 
Shape	Shallow-bodied, e.g. clown wrasse 	Deep bodied, e.g. butterflyfish 
Aggregation size	Solitary, e.g. Spanish hogfish 	Schooling, e.g. French grunt 
Water column position	Benthic fishes, e.g. masked goby 	Pelagic fishes, e.g. bar jack 
Nocturnally active	Yes, e.g. squirrelfish 	No, e.g. striped parrotfish 
Cleaning behaviour	No, e.g. French angelfish 	Yes, e.g. neon goby 

# Important consequences for endemic species

## Social Wrasse (*Halichoeres Socialis*)

A single lionfish can consume dozens of juvenile social wrasses every day  
Lionfish are pushing this critically endangered specie closer to extinction

### Why are they important?

They feed on plankton that comes from the open ocean, which serves as a nutrient source for the reef itself, transferring resources from the open ocean to the reef

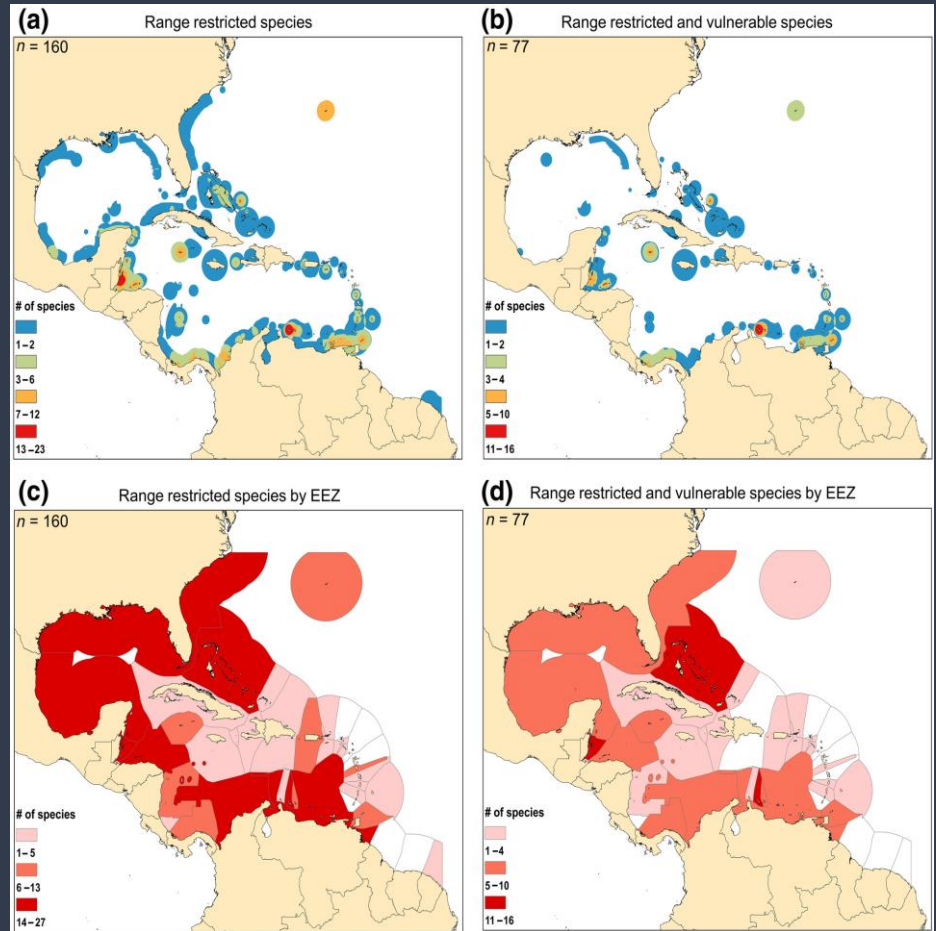

Removing them can have severe impacts on the local ecosystem's health

# Belize is a hotspot of potential impact

- **Bahamas, Belize and Curaçao** identified as vulnerability hotspots - 77 fishes with small ranges identified at risk

# National Lionfish Management Strategy and working group (2019-2023)

---

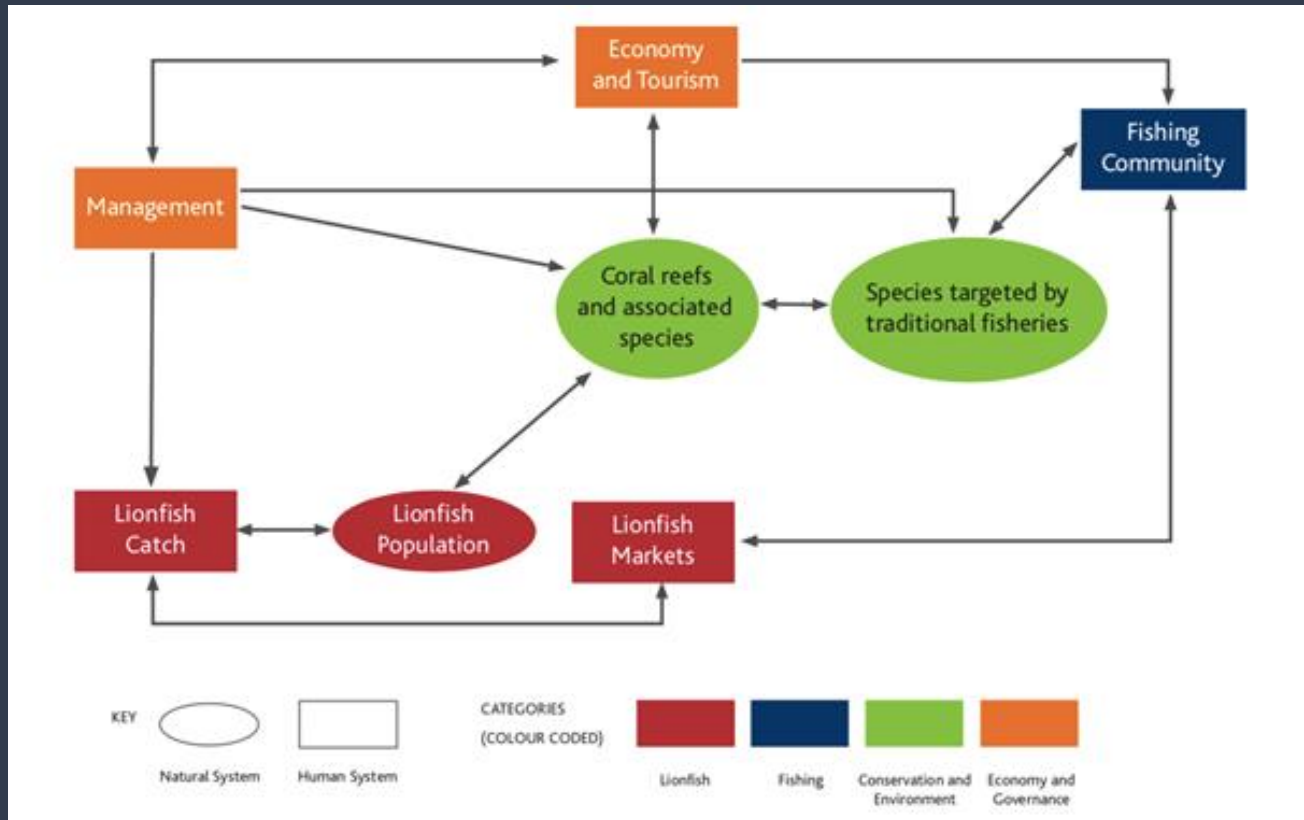

## ***Vision***

Adaptively managing lionfish in a participatory manner, to protect and improve livelihoods of all Belizeans and the health of Belize's marine environment.

## ***Key objective***

A key objective of this strategy is to develop a long-term community-led monitoring program, responsible for guiding effective lionfish management, monitoring and evaluation efforts across Belize.

# Recognising the interconnectedness of the system

# \*2015 national priority assessment

PA, Management Entity & Managed Access area	Justification	Priority Level (low, med, high)
Southwater Caye Marine Reserve (SWCMR), Belize Fisheries Department: Managed Access Area 3	Based on 2015 survey results, had highest lionfish density.	high
Sapodilla Cayes Marine Reserve (SCMR), Belize Fisheries Department: Managed Access Area 4	Based on 2017 observations there were a lot of lionfish, but in 2019 sightings were low; gaps in knowledge exist for monitoring; little diving activity for Sap Cayes and this could mean little is an indication for increased presence of lionfish control is occurring	high
Caye Caulker Marine Reserve (CCMR), Belize Fisheries Department: Managed Access Area 1	Need more lionfish control in certain areas; 2015 surveys showed areas exist with high and low lionfish counts	high
Bacalar Chico Marine Reserve (BCMR), Belize Fisheries Department: Managed Access Area 1	Need higher level of control of lionfish removal	high
Turneffe Atoll Marine Reserve (TAMR), Turneffe Atoll Sustainability Association: Managed Access Area 6	An existing gap, previous studies have indicated high numbers; possibility that no-take-zones have high numbers of lionfish; general-use-zones also need to be surveyed for comparison	high
Gladden Spit & Silk Cayes Marine Reserve, Southern Environmental Association: Managed Access Area 3	Juvenile sightings are high especially in whale shark zone (phase I & III); 2014 baseline data exists with SEA and BV	high

2020+

## Establishing effective lionfish management in Belize's fish replenishment zones

Support Belize MPA managers to establish a scalable model for effective and participatory lionfish adaptive management

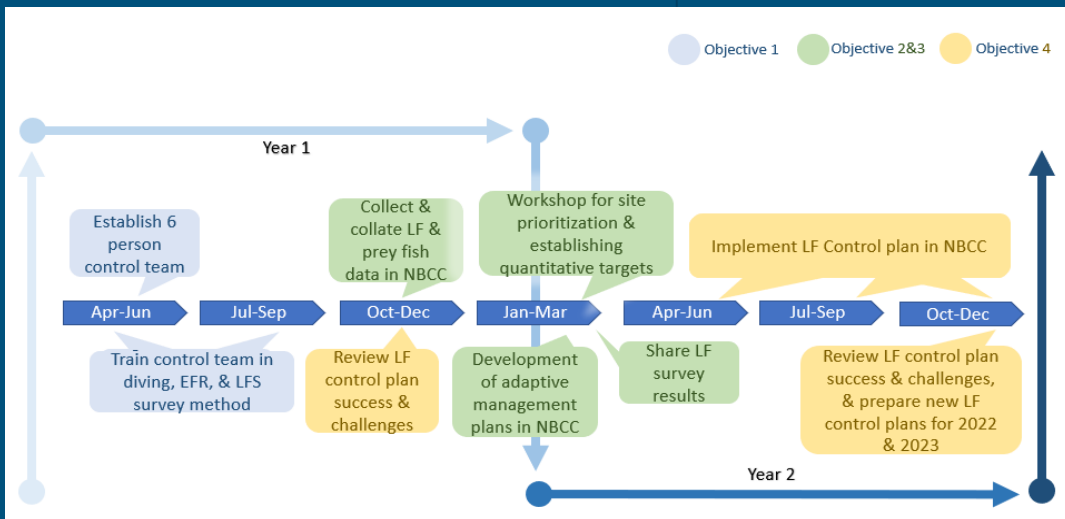

Focus: capacity building, involving key stakeholders, & piloting an approach that can be replicated throughout the LAC region

thewaterloofoundation\*

# Project components & activities

# Training & capacity building

Since 2020, BV has trained 18 MPA staff and partners in:

- Lionfish Focused Search (LFS) survey methods
- Principles of lionfish monitoring and adaptive management
- Fish ID training
- PADI scuba certification
- Emergency First Response & First Aid

# Assessment

Updated population status surveys (LFS method) in 4 MPAs

- BCMR
- CCMR
- HCMR
- TAMR
- SWCMR (planned 2022)

# Survey method

- All data collected using **LFS Method** - *regional protocol for monitoring lionfish & impacts for complex reef systems*
- All surveyors trained and certified in LFS and Fish ID
- 3 components:
  - 1). >30cm fish** (50m x 1m transect)
  - 2). Roving diver survey for lionfish and competitor species** (50m X 10m)
  - 3). Prey surveys** (2m x 20m)

# LFS method (Green et al., 2012)

# Lionfish and competitor surveys

# Key questions?

- How many lionfish to remove?
- How much effort is required?
- Which areas should be prioritized?

# Suppression in high priority areas

Juvenile fish habitat

Marine Protected Areas

# Suppression in high priority areas

Juvenile fish habitat

Marine Protected Areas

The goal:

**Make the most effective use  
of limited resources**

# How many lionfish can a reef tolerate?

$$\bar{d}_x = \frac{\frac{1}{Z} \sum_{\forall z} \sum_{\forall i} \sum_{\forall v} \left( \frac{jW_{v,i,z}^q}{E} \right) W_{v,i,z}}{\bar{W}_x \bar{p} (g e^{0.16T} \bar{W}_x^c) y}$$

Surveys of fish biomass

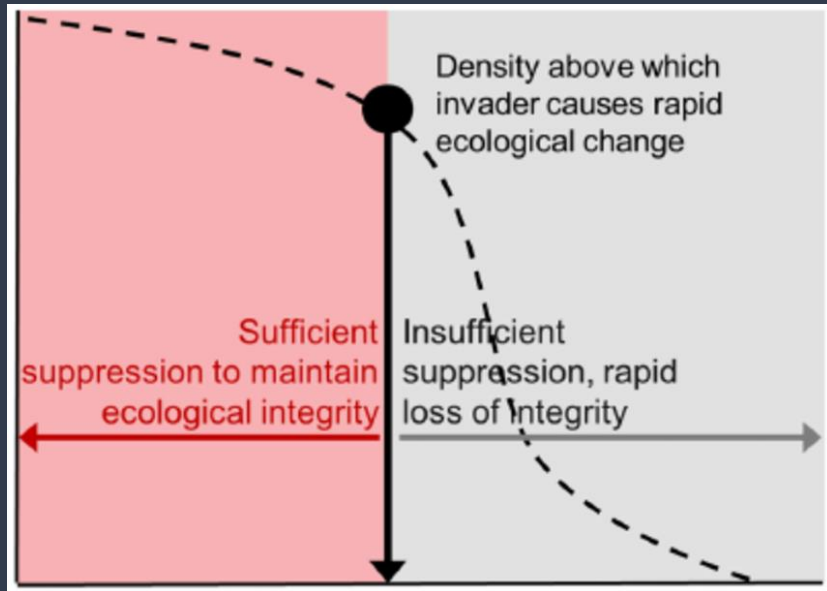

Predation rates

Lionfish densities  
and body sizes

# Using Limits of Acceptable Change

*Green et al. (2014) Linking removal targets to the ecological effects of invaders: a predictive model and field test. Ecological Applications 24(6):1311-1322*

# Established control plans with quantitative targets

FISHING ZONE COMPLIANCE

# Adaptive management: Turneffe Atoll

Indicators	2020	2021	Change
<i>Average Total Length (cm)</i>	22	21	↓
<i>Lionfish density (ind./ha)</i>	77	46	↓
<i>Threshold density (ind./ha)</i>	24	12	↓
<i>% sites exceeding threshold</i>	46	38	↓

# Lessons learned

---

- adapt to suit needs of MPA
- participatory & community-led
- more emphasis on data sharing & feedback with communities
- LFS method resource intensive/expensive

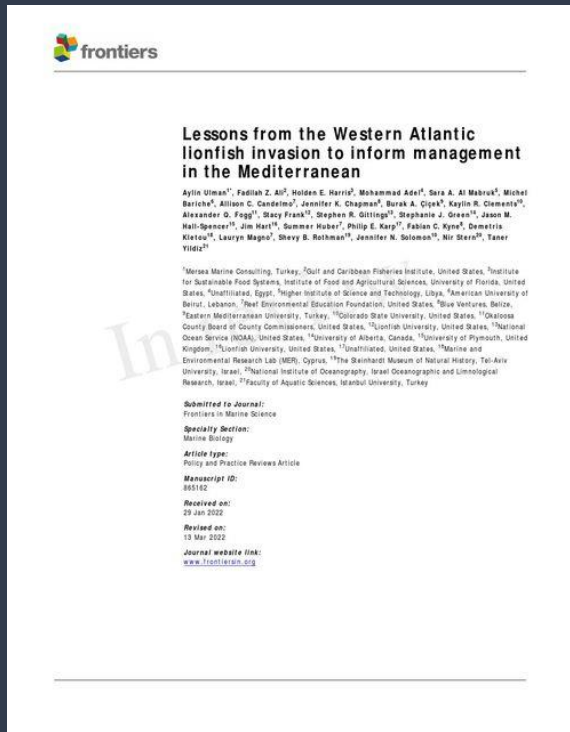

# Lessons learned

**\*\*New inclusive and participatory lionfish removal policy\*\*** – Approved by the Belize Fisheries Department, August 2022

# Target - LF control in 25% Belize's nearshore by 2024

## DO'S AND DON'TS OF LIONFISH MANAGEMENT

### PROMOTE LIONFISH HUNTING TOURISM

Helps support dive operators and tourism; divers need training and proper equipment.

### ALLOW HARVEST VIA SCUBA AND POLE SPEARS

Noncompliance can be mitigated by gear use restrictions and working with stakeholder groups.

### ENCOURAGE RECREATIONAL TOURNAMENTS

Derbies provide a participatory approach to conduct removals, research, and public education.

### ENCOURAGE COMMERCIAL MARKETS

Develop market-based solutions to control lionfish densities and diversify fishers' catches.

### ENCOURAGE PARTICIPATORY MANAGEMENT

Stakeholder engagement can support removals, market building, and strategic planning.

### COORDINATE REGIONAL MANAGEMENT

Biological invasions require rapid and strategic management approaches with multinational cooperation.

### DON'T RELY ON "BOUNTY" PROGRAMS

Funds can be quickly exhausted. Sustainable control is better achieved by improving education, stakeholder engagement, and lionfish fisheries.

### DON'T "TRAIN" NATIVE PREDATORS

Feeding speared lionfish to predators results in aggressive behavior by them towards divers.
